Executive Summary

We dug into the restored Social Engine dataset to see what was really going on under the hood. By running SQL queries on the data, we mapped out which platforms are actually performing best, tested if having a huge follower count really matters for engagement, and hunted down some highly suspicious accounts that look like they are using bots to inflate their numbers.

1. Platform Trends: Video & Traditional Social Win

When we looked at average engagement (Query E3), YouTube and Facebook took the lead with over 3,820 average interactions per post, as shown in the chart below. Twitter lagged behind. This shows us that visual and video-heavy platforms are keeping users hooked much better than text-heavy micro-blogging.

2. Follower Count is Overrated

We grouped users by their follower counts (Query M2) to see if big accounts get exponentially more engagement. Surprisingly, they do not. Accounts with over 25k followers averaged 3,787 interactions, while those under 25k averaged 3,768. The main takeaway here? Content is king, and algorithmic distribution levels the playing field.

3. Spotting the Fake Engagement

The most interesting part of the analysis was finding the anomalies (Query H6). We found a few specific accounts with barely any followers that were racking up massive engagement numbers (over 64,000 interactions). More importantly, these accounts had way more shares than likes - a massive red flag for bot activity or engagement rings.
